Determining disk-loads using a combined ballistics test and wear curve approach. Wear areas on the surfaces of equine hoof shoes are indicators of the level of impact and loading experienced by the horse over a period of time. Together with the age of the shoe, these wear areas can be used to determine the horse's trotting distance at a specific age. Based on this information, the hoof should be recapped to the trotting distance indicated by the shoe. Wear charts are commonly used to document the progression of wear in hoof boots. The charts are often produced using a ballistics test, in which a 2.5-kg steel ball is dropped from a fixed height on to the shoe. A wear curve is then generated using the loading data collected as the ball is dropped from the fixed height. This approach enables the level of impact for a specific shoe to be determined, but requires that the shoe be removed from the horse. This can have a negative impact on owner and trainer behavior, and thus a means of determining wear should be investigated before such a chart is produced. In the current study, hoof boots were fitted to horses to evaluate how the loading of a shoe is related to areas of equine hoof wear. A novel approach was used to determine loading by drop testing (along with mathematical modeling) and the wear areas were then evaluated using a combined ballistics-wear curve approach. Results from the study confirmed that the loading determined by drop testing corresponds to areas of wear, indicating that the ballistics test could be used to determine loading.The utility of simultaneous tissue Doppler imaging and aortic root strain measurement for identification of increased aortic stiffness in patients with atrial fibrillation. The purpose of this study was to assess aortic stiffness index (SI) in patients with atrial fibrillation (AF) and to test the utility of a noninvasive measurement technique for the prediction of aortic stiffness. Aortic stiffness is an independent risk factor of atherosclerotic complications in AF patients and affects the prognosis of ischemic stroke. Noninvasive measurement of aortic stiffness using the carotid-femoral pulse wave velocity (PWV) is impractical because PWV is affected by aortic elasticity. Recently, tissue Doppler imaging (TDI) has proven useful in noninvasive assessment of aortic stiffness in patients with hypertension. We enrolled 113 patients (61 ± 10 years)
